

Know about Top Spider Vein Doctors

Sclerotherapy by **Top Spider Vein Doctors** is a non-surgical technique that can treat most varicose veins and spider veins in the legs. Each sclerotherapy treatment takes approximately 20 minutes and the number of treatments depends on the severity of the problem. Most patients report no pain or report very mild discomfort. After the treatment you can immediately resume your normal activities and encourage exercise and walking.

The areas with vein problems tend to get worse with time, to prevent the expansion of the [Leg Heaviness](#) problem you have to start the treatment before feeling symptoms of pain, fatigue, irritation, burning and inflammation. You may also feel palpitations and restlessness, to the point where you feel you must move your legs constantly.

Laser therapy Endovenosa EVLT

Studies show that EVLT has a 98% success rate with excellent results initial long term. EVLT by **Top Spider Vein Doctors** is a nonsurgical procedure which involves placing a small catheter into veins. The laser energy affects the walls of the veins, causing the entire vein to disappear. This eliminates the bulging vein from its origin. A small number of patients report a slight numbness after the EVLT treatment, which passes quickly.

What are varicose veins and spider veins?

Veins that can be seen near the surface of the skin that are usually swollen and dark are varicose veins. They typically appear on the legs. Similarly, spider veins are like small varicose veins that appear near the surface of the skin.

Causes of Leg Heaviness

Vascular veins usually form when small valves in the veins break allowing blood to travel in the wrong direction. This causes the veins to swell and fill with stagnant blood. They can also appear deep under the skin, where it is not possible to see them.

However pregnancy, obesity and standing for long periods of time can help aggravate vein disease that does not mean that all these conditions are really the cause of the disease.

How the varicose veins and spider veins look:

They appear as enlarged and twisted dark red or blue lines under the skin. Many people describe them as being similar to a string and filiform.

Who is the best candidate for this treatment?

If you have a vein that has led to discomfort or bother with the appearance, you are a candidate for this treatment.

How many treatments are needed?

It is impossible to determine how many treatments or what kind of [Treatment For Leg Heaviness](#) is required without evaluating the problem. A non-invasive ultrasound test will be carried out if necessary and then an individualized treatment plan will be developed for you.

What can be expected after treatment?

You can return to your regular activities immediately and can return to your rigorous activities after 2 days. Some patients may experience raised hives and itching or tingling immediately after or during treatment that will resolve within a few hours. The blood vessels gradually clear up and disappear a few weeks after treatment, with the larger veins taking longer to disappear.
